

Auzex locates molybdenum and copper anomaly at Mt Radiant

12 May 2008, Source: Auzex Resources and Lindsay Clark - Auzex Resources has identified a well defined molybdenum and copper prospect at Mt Radiant, inland from Karamea in the Buller area of the South Island West Coast.

Auzex says in its three month report to March 31 2008 that it has completed exploration at the anomaly at Mt Radiant in PEP 40846.

The well defined molybdenum and copper soil anomaly has been identified, which occurs away from the known workings and measures approximately 400m x 200m.

Results for twelve rock chip samples taken from within the main soil anomaly included five samples assaying greater than 200 ppm Mo.

Detailed mapping is planned to allow drill targeting to be completed.
